

WRIGLEY FIELD: A CONCRETE LEGACY

Wrigley Field. Home to the Cubs and to some of the most loyal baseball fans around. But there's another reason it holds such a lasting legacy; the structure itself. Constructed with over 45,200 cubic feet of concrete, it's a stadium that hasn't just lasted the test of time. It's a shining example of why concrete has been, and continues to be, one of the most resilient building materials on earth.

OVER 100 YEARS OLD

Established in 1914 during the nation's largest architectural and industrial boom, it's the second oldest baseball stadium in the Americas.

STILL STANDING STRONG

Remains one of the world's most iconic stadiums. While other stadiums have been completely rebuilt due to deterioration, Wrigley Field has only maintained and reinforced its structure.

BUILT WITH CONCRETE

More than 45,200 cubic feet of concrete was used during the original construction—and it's one of the core materials used for renovations as well.

KEEPING A GOOD THING GOING

During a recent renovation in 2012, Osborn Engineering chose concrete construction for a new Wrigley Field observation deck, resulting in 420 cubic feet of concrete.

STRENGTH BY THE NUMBERS

Nearly 3 million people go through the gates of Wrigley Field each year—a testament to lasting durability and resilience.
